

Filedgr Property Vault – Proposed Architecture (MVP & Future Vision)

Core Philosophy

The Property Vault is designed around a simple principle:

Separate the property's permanent history from the homeowner's private information.

The Vault is attached to the physical property, not the individual owner. Four permanent data streams travel with the property throughout its lifetime, while one private stream belongs exclusively to the current homeowner and is never transferred during a sale.

MVP (Demo)

For the initial demonstration, the Property Vault consists of five simple data streams:

1. Home Profile

The original identity of the home.

- Floor plans
 - Builder documents
 - Material specifications
 - Paint colours
 - Certificate of Occupancy
 - Initial surveys
-

2. Maintenance & Upgrades

The ongoing history of work performed on the property.

- Repairs
- Renovations
- Maintenance records

- Contractor invoices
 - Photos
 - Inspection reports
-

3. Systems & Warranties

Information relating to installed equipment.

- HVAC
 - Appliances
 - Solar
 - Smart home devices
 - Manuals
 - Serial numbers
 - Warranties
-

4. Property Records

Legal and operational property information.

- Deeds
 - Surveys
 - HOA documentation
 - Zoning
 - Permits
 - Compliance records
-

5. Personal Vault (Private)

Information belonging only to the current homeowner.

- Mortgage documents
- Insurance policies
- Insurance claims
- Property taxes
- Financing documents

This stream is automatically detached when ownership changes and never transfers to the buyer.

Property Transfer

When ownership changes:

Transferred

- Home Profile
- Maintenance & Upgrades
- Systems & Warranties
- Property Records

Not Transferred

- Personal Vault

The seller retains a private archive, while the buyer receives a new empty Personal Vault.

Future Vision (Architectural Options)

The five-stream architecture provides a simple and scalable foundation for the MVP. As the platform evolves, there are multiple ways the user experience could expand while retaining the same core transfer logic.

Option 1 – Property Timeline (Linked Events)

Introduce a **Property Timeline** where major events (e.g., renovations, repairs, inspections, storm damage) become chronological entries.

For example:

Tree Damage – August 2028

- Damage photos (Maintenance & Upgrades)
- Roof replacement invoice (Maintenance & Upgrades)
- Building permit (Property Records)
- New roof warranty (Systems & Warranties)
- Insurance claim (Personal Vault)

In this model, documents remain stored within their appropriate data streams, while the timeline simply links them together into a single chronological view. This avoids document duplication while providing a complete history of the property.

Option 2 – Event-Based Vaults

An alternative approach would be to introduce **Event Vaults** for major projects or incidents.

For example:

Roof Replacement – 2028

- Photos
- Contractor estimate
- Invoice
- Warranty
- Permit
- Inspection
- Insurance correspondence

Each Event Vault would group all documents related to a single project or incident in one place, regardless of document type. This may feel more intuitive for homeowners, as people naturally think in terms of projects ("Kitchen Remodel", "Roof Replacement", "Tree Damage") rather than document categories.

The underlying five data streams could still exist as the permanent data model, with Event Vaults acting as an additional organizational layer or alternative view.

Both approaches build upon the same MVP architecture and are not mutually exclusive. The initial release can focus on the simple five-stream Property Vault, while future iterations can evaluate whether linked timelines, Event Vaults, or a combination of both provides the best homeowner experience.
